triphosphatase.

phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic recticulum Ca 2+ Argase (SERCAZa) within catching cargo populae deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ Argase (SERCAZa) within catchingoverses. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCAZa interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the cargo peptide from human PLB amino terminal residues 1-16. It could be derived from any segment of wild type or mutant PLB protein. The cargo peptide is linked to the transport peptide by a covalent linkage The patent discloses a method for the treatment of heart failure, using

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.

Example 5; Page 52; 56pp; English.

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPease (SERCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against DLB protein (contractilly). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the penetratin-based recombinant peptide TAT-PLB, comprising the amino terminal end of human PLB native protein, attached to the 3' end of denatured human immunodeficiency virus (HIV), TAT protein. Penetratin is a class of peptides, with translocating properties having the ability to carry hydrophilic compounds across the plasma membrane

```
The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, C22+ Afpease of the sarco/endplasmic reticulum, appearing as ADB45167-CA54723. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, AR-9 and/or Ar-9.13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound to binding site comprises Met-20, Lys-27 and/or Let phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-12 and/or Phe-15.7-binding site of the phospholamban, comprising administering the novel compound to stimulate the case of phospholamban, comprising administering the novel compound to stimulate the compound is not 3-benzopyzan-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the compound is companied SERCA_2. The present sequence is the cytosolic domain of human phospholamban.
                                                 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+
                                                                                                                                                                                                                                                                                                                                                                                                  Human; SERCA 2; phospholamban; PLB; Ca2+ ATPase \overline{o}f the sarco/endoplasmic reticulum; protein co-ordinate data;

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase

Disclosure; Page 48; 56pp; English.

small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum (a 2+ Arpase (SERCA2) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against the protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising a sense mutation (al49Ala. This mutant sequence when overexpressed in the transformed cardiomyocytes, shows increased contractility than the wild type PLB sequence The patent discloses a method for the treatment of heart failure, using

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.

Disclosure, Page 47; 56pp; English.

small peptide complexes and recombinant proteins, that induces phospholemban (PIB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ Arpase (SERAA2) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human PLB wild type protein, a potent inhibitor of SERCA2a acitivity. It primarily exists in a pentameric form. It is a medialor in the regulation of myocardial function by catecholamines through the CAMP cascade patent discloses a method for the treatment of heart failure, using

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP00010 to ABN1500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polytucloctide squares can be used in gene therapy ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, rithosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eve disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bene degenerative disorders, ulcers, ulcers, and for gut protection or regeneration and treatment of lung or liver fibrosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psortiasis; behign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune chiroidistis;

```
The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, 22.4 ATPage of the sarco/endoplasmic reticulum (a) appearing as ADE45167-ADE45173. The compound has a structure containing three of the four moietises: an electromegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site occapitation with an S2 binding site of the phospholamban cytosolic domain when the compound is bound, the S2 binding site of the phospholamban cytosolic moiety associating with an S2 binding site of the phospholamban cytosolic of main when the compound is bound, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, 1ys-27 and/or Leu-28, and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, 1ys-27 and/or Leu-28, and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain when the compound is not 3-benzyl-5/-bis ([H-tetrazol-5-4)]-methyloxyl-4 methyl-2H-methyl-2H-methyl-2H-methyloxyl-4 methyl-2H-methyloxyl-4 methyl-2H-methyloxyl-4 methyl-2H-methyloxyl-4 methyloxyl-4 me
                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse; SERCA 2; phospholamban; PLB;
Ca2+ ATPase of the sarco/endoplasmic reticulum; protein co-ordinate data;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+
reperfusion injury in various tissues and conditions resulting from systemic cytoKine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERGA 2, Ca2+ ArPase of the sarco/endoplasmic reticulum, appearing as ADS45167-CADE45173. The compound has a structure containing three of the four moieties: an electromegative moiety associating with an S1 binding site of the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electromegative moiety associating with an S2 binding site of the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electromegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is not 3-benzyl-5,7-bis ([1H-tetrazol-5-y]) -methyloxyl-4 methyl-2H-methyl-2H-benzopyran-2-one. Also included are deactivating the compound is not 3-benzyl-5,7-bis (classes) for stimulate the Ca2 + -Arpase. The compound is useful for relaving the inhibitory as a sociating phospholamban on cardiac SERCA_2. The present sequence is a
                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                      Rabbit; SERCA 2; phospholamban; PLB;
Ca2+ ATPase of the sarco/endoplasmic reticulum; protein co-ordinate data;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+
                                                                          Gaps

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA. 2, Ca2+ Arpsae of the sarco/endoplasmic reticulum) appearing as ADB45167-CADB45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyre, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Arg-14, a hydrophobic moiety associating with an S3 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of methyl-2H-methyl-2H-1-benzopyran-2-one. Also included are deactivating the capture of the call argument of the call argument is not 3-benzyl-57-bis ([Hr-tetrazol-5-yl])-methyloxyl-4 call argument compound is not 3-benzyl-57-bis ([Hr-tetrazol-5-yl])-methyloxyl-4 call argument compound is not 3-benzyl-57-bis ([Hr-tetrazol-5-yl])-methyloxyl-4 call argument compound is useful for relieving the inhibitory call argument of the call argument is a useful for relieving the inhibitory call argument is a useful for relieving the inhibitory call argument is a serial for relieving the inhibitory call argument sequence is a second and argument argum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+ -ATPase.

Claim 1; SEQ ID NO 1; 65pp; English

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, ALSTA AFFASSES of the sarco/endoplasmic reticulum ) appearing as ABB45167-ADE45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an SI binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyre, Arg-9 and/or Arg-13; an electronegative moiety associating with an SZ binding site of the phospholamban cytosolic domain when the compound is bound to it, the SZ binding site comprises Arg-14; a hydrophobic moiety associating with an SJ binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-28; and a hydrophobic moiety

```
associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-32 and/or Phe-35. The compound is not 3-benzyl-5,7-bis ((H+tetrazol-5-yl)-methyloxy)-4-methyl-2H-methyl-2H-benzopyran-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the Ca 2 + -Arpase. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is
                                                                                                                                                                                                            human phospholamban.

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.

```
The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPase (SERCAZA) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCAZA interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the dystunction. The present sequence is the hexahistidine (H6) tagged penetratin-based recombinant protein H6-mutantPLB-ANT, comprising the human mutant (Val 49Ala) PLB protein and Drosophila antennapedia (ANT) expressed in Escherichia coli cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Corresponds to Human phospholamban (PLB) protein"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phospholamban, PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardiomyocyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; recombinant protein; fruit fly; ANT; antennapedia; H6 tag; hexahistidine.

small peptide complexes a martine to the transmitter, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and astrophasmic resticulum (a 2+ Arpase (SERCA2a) within cardiomycoytes. The peptide complexes contraction between PLB and sarcophasmic resticulum (a 2+ Arpase (SERCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against pub protein (contractilin). Penetratin-PLB peptide functions as a contractility and reduces blood pressure. This method is useful for the transmit of cardiac disease e.g. heart failure and myccardial cystunction. The present sequence is the hexahistidine (H6) tagged penetratin-based recombinant protein H6-wPLB-ANT, comprising the wild type human PLB protein and prosophila antennapedia (ANT) transport peptide attached by a hexahistidine tag. This sequence is expressed in Bscherichia coli cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardiomyocyte; transport peptide; penetratun; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; mutant.
           Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                         The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant marries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hoshijima M, Meyer M;

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.

Disclosure; Page 49; 56pp; English.

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum C2 + ATPase (SERCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide complex comprises of transport peptide like penetratin and plb protein (contractilin). Penetratin-PLB peptide functions as a contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising the mutation Serl6Asm. This mutant sequence when contractility than the wild type PLB sequence.

New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+ -ATPase.

Claim 1; SEQ ID NO 2; 65pp; English.

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, Ca2+ ATPase of the sarco/endoplasmic reticulum ) appearing as ADE45167-

ADE45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr.6, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is abound, the binding site comprises Phe-32 and/or Phe-SC The compound is not 3-benzyl-57-bis ([Hr-tetrazol-5-4)]-methyloxyl-4 methyl-2H-methyl-2H-1-benzopyran-2-one. Also included are deactivating the case of phospholamban on cardiac SERCA\_2. The present sequence is a phospholamban.

New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+ -ATPase.

Claim 1; SEQ ID NO 3; 65pp; English.

The invention relates to a compound which deactivates, and exhibits stiffinity for, a phospholamban (PIB) protein (an inhibitor of SERCA\_2, Ca2+ ATPASE of the sarco/endoplasmic reticulum ) appearing as ADE45167-ADE45173. The compound has a structure containing three of the four angeleis: an electronegative moiety associating with an SI binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative

small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum (a 2+ Arpase (SERCA2a) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a contractility and reduces blood pressure. This method is useful for the trachment of cardiac disease e.g. heart failure and myocardial cyptide TAT-mutant PLB, comprising the amino terminal end of human PLB mutant (Ser31Glu) protein, attached to the 3' end of denatured human pub immunodeficiency virus (HIV), TAT protein. Penetratin is a class of peptides, with translocating protein, penetratin is a class of hydrophilic compounds across the plasma membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardlomyocyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; mutant; treatment; heart failure; myocardial dysfunction; recombinant protein; fruit fly; ANT; antennapedia.
                                                                                                                   discloses a method for the treatment of heart failure, using

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ Arpase (SERCA2a) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the dysfunction. The present sequence is the penetratin-based recombinant optide, mutant PLB-ANT, comprising the amino terminal end of human PLB mutant (SerI6Glu) protein, attached to the S' end of the Drosophila antennapedia (ANT) transport peptide. Penetratin is a class of peptides, with translocating properties having the ability to carry hydrophilic compounds across the plasma membrane
                                                                  Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, phospholamban, PLB, cardiant, heart disease, gene therapy, cardiac function, mutant, mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .,

Delivering a dose of a gene expression cassette in a fluid selectively to heart for sustained expression, useful for improving or enhancing cardiac function, by employing a viral vector together with a vascular permeablizing agent.
                                                                                                                                                        The invention relates to delivering a therapeutic dose of a gene expression cassette in a fluid selectively to heart for sustained expression, comprising employing a viral vector together with a vascular permabbilising agent. The method is useful for gene therapy delivering genes for improving or enhancing cardiac function, particularly in hamster models of heart disease. The present sequence is that of a pseudophosphorylation mutant of phospholamban (SIGEPLB). This point mutant is among a number of dominant negative mutants identified and characterised in WOO0/25804 and used in the method of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chicken; SERCA_2; phospholamban; PLB;

ó
of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative moiety associating with an $2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the $2 binding site comprises Arg-14; a hydrophobic moiety associating with an $3 binding site of the phospholamban cytosolic domain when the compound; the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-32 and/or bhen the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is not 3-benzopxan-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the Ca 2 + -ATPase. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is a

phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPase (SERCA2a) within cardiomycytes. The peptide complexes of transport peptide like penetratin and cargo peptide complexes of transport peptide like penetratin and cargo peptide complexe comprises of transport peptide like penetratin and PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the hexahistidine (H6) tagged penetratin-based recombinant protein H6-mutantPLB-ANT, comprising the human mutant (SerlGGlu) PLB protein and Drosophila antennapedia (ANT) transport peptide attached by a hexahistidine tag. This sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a;
                              Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                      patent discloses a method for the treatment of heart failure, using

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enthancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.

Disclosure; Page 48-49; 56pp; English.

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPASE (SERCA2a) within cardiomycoyres. The peptide complex comprises of transport peptide like penetratin and PLB protein (contractilin). Penetratin-PLB peptide like penetratin and pub protein (contractilin) Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising a sense mutation Argiddlu. This mutant sequence when contractility than the wild type PLB sequence

comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.

Disclosure, Page 48; 56pp; English.

small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2 + ATPase (SERCA2a) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising the mutation diuzala. This mitant sequence when contractility than the wild type PLB sequence patent discloses a method for the treatment of heart failure, using

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction

comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine riphosphatase.

Disclosure; Page 49; 56pp; English.

small peptide complexes and recombinant proteins, that induces the phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2.4 ATPase (SERCA2A) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, mative PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and mycardial dysfunction. The present amino acid sequence is the human mutant PLB protein. Comprising the double mutaction hysaldu and Argisclu. This mutant sequence, when overexpressed in the transformed cardiomycytes, shows increased contractility than the wild type PLB sequence The patent discloses a method for the treatment of heart failure, using

Bunkers GJ, Liang J, Mittanck CA, Seale JW, Wu YS; WPI; 2003-754558/71. Novel antifungal protein FCWP1, isolated from Fusarium culmorum, useful for controlling fungal infections in plants.

Example 21; SEQ ID NO 181; 27pp; English.

The invention relates to an isolated antifungal ribosomal protein from

(e.g. Wycoghuereria inguentals), Nectica (Nectical Coccas), Phoma Detae), Phymatotrichum (e.g. Phymatotrichum (e.g. Phymatotrichum (e.g. Phymatotrichum omnivorum), Phytophthora parasitica, Phytophthora cactorum, Phytophthora parasitica, Phytophthora cactorum, Coccatorum, Phytophthora parasitica, Phytophthora (e.g. Phytophthora parasitica, Phytophthora (e.g. Phytophthora parasitica, Phytophthora (e.g. Phytophthora parasitica, Phytophthora (e.g. Phytophthora (e.g. Phytophthora (e.g. Phytophthora (e.g. Pragnapara viticola), Podosphaera (e.g. procinia graminis f.sp. tritici, Puccinia asparasi, Puccinia graminis f.sp. tritici, Puccinia asparasi, Phytophthora (e.g. Phytophthora (e.g. Pytriularia (e.g. Scerotium Polfsii), Sclerotinia (e.g. Scerotium Phaeosphaeria (e.g. Septoria glycinia (e.g. Septoria glycinia (e.g. Septoria diginia parasionia), Uncinula (e.g. Uncinula necator), Venturia nodorum, Phaeosphaeria nodorum, Septoria tritici), Thielaviopsis (e.g. Venturia inaequalis) or Verticillium (e.g. Verticillium albo-atrum). Mutations in the proteolytic consensus contained within FCMP1 provides improved stability of its sequences contained within FCMP1 provides improved stability of its antifungal activity. Also disclosed are ribosomal proteins with similar consensus proteins similar to FCMP1, which may act as antifungal staticillium delications in the proteolytic consensus antifungal proteins The present sequence represents one of the ribosomal proteins similar to FCMP1 (e.g. Proteins similar to FCMP1) which may act as antifungal activity. New disclosed are ribosomal proteins with similar consensus contained within FCMP1 provides tepresents one of the ribosomal proteins similar to FCMP1, which may act as antifungal series similar to FCMP1, which may act as antifungal activity. New disclosed are ribosomal proteins with similar consensus contained within FCMP1) and molecular weight (<2000a) to F signal peptide of the antifungal protein AlyAFP from Alyssum and PCWP1, encoded by the nucleic acid appearing as ADC87758. The PCWP1 proteins are useful for controlling fungal infections in plants, such as those caused by Alternaria (e.g. Alternaria brassicola, Alternaria solani), Ascochyta (e.g. Ascochyta pisi), Botrytis (e.g. Botrytis cinerea), Carcospora (e.g. Ascochyta pisi), Botrytis (e.g. Botrytis cinerea), Collectotrichum (e.g. Collectotrichum indemuthianum), Diplodia (e.g. Diplodia maydis), Pusarium (e.g. Fusarium mivale, Pusarium oxysporum, Fusarium graminearum, Pusarium culmorum, Fusarium solani, Fusarium moniliforme, Fusarium roseum), Gaeumanomyces (e.g. Macrophomina phaseolina, Maganaporthe grisea), Mycosphaerella (e.g. Mycosphaerella figiensis), Nectria heamatococa), fusarium culmorum, FCWP1. Also included is a fusion protein between the segdata.uspto.gov/seguence.html?DocID=6573361Bl.

Sequence 5136, Application US/09134001C

Sequence 5136, Application US/09134001C

SEMENTAL INFORMATION:

APPLICANT: Lynn Doucette-Stamm et al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS

TITLE OF INVENTION: DEPLEMENT OF TOWN THERAPEUTICS

FILE REFERENCE: GTC-007

CURRENT APPLICATION NUMBER: US 60/064,964

PRIOR PLING DATE: 1997-11-08

PRIOR PLING DATE: 1997-11-08

PRIOR FILING DATE: 1997-06-14

NUMBER OF SEQ ID NOS: 5674

SEQ ID NO. 5136

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 14, Application US/09620461

Patent No. 6635750

GENERAL INFORMATION:

APPLICANT: COVIE, Anthony J.

APPLICANT: Braser, Christopher C.

APPLICANT: Manning, Stephen

TITLE OF INVENTION: E-Maily and Uses Thereof

TITLE REFERENCE: 5800-149

CURRENT APPLICATION NUMBER: US/09/620,461

CURRENT PILING DATE: 2000-07-20

NUMBER OF SEQ ID NOS: 29

SOFTWARE: PastSEQ for Windows Version 3.0

SEQ ID NO 14

LINGTH: 357
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GENERAL INFORMATION:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
